Abortion: This includes induced early fetal deaths and excludes spontaneous abortions (miscarriages).

Cause of death: In this publication, causes of death are cited in keeping with the International Classification of Diseases and Related Health Problems (ICD) (Xth Revision, 1975: "accidents, poisoning and violence" (XVII.800-999); "suicide and self-inflicted injury" (XVII.950-999).

Children in infant homes: The number of children in infant homes is a useful proxy for indicators of child abandonment and institutional care. Infant homes typically care for very young children (0-3 years) who have been left without parental care, although infants may enter the homes on temporary placement, and children may also sometimes be above 3 years old.

Consumer price index: The most widely used measure of inflation, the CPI is a comparison of the price levels of a representative basket of consumer goods and services recorded in retail trade outlets and service units during two periods. The aggregate index is based on actual consumer expenditure patterns gauged through household surveys.

Crime and sentencing rates: Crime data cover reported and registered crime only. Crime and sentencing rates are subject to national legislation, which varies widely within the region. This hinders comparisons among countries and years.

Crude birth rate: The CBR measures the frequency of childbirths in a population. In the Statistical Annex it represents the number of live births per 1,000 mid-year population.

Crude death rate: The CDR measures the frequency of deaths in a population. In the Statistical Annex it represents the number of deaths per 1,000 mid-year population.

Enrolment rates: The net enrolment rate is based on the number of children enrolled at a given level of education divided by the total number of children in the same age group in the general population. The gross enrolment rate is based on the number of children, regardless of age, enrolled at a given level of education divided by the total number of children in the general population that corresponds to the age group specified for that level of education.

Enrolment rates by education level: Selected definitions in the International Standard Classification System of Education Levels (ISCED) are given below as a general guideline, though the situation may differ among countries.

- Kindergarten (ISCED 0): This generally covers children in the 3-5 or 3-6 age group and excludes nursery provision for the 0-2 age group.
- Basic education (ISCED 1 and 2): Basic education, often called "compulsory schooling" or "elementary schooling", normally lasts from age 6 or 7 to age 14 or 15. This is often divided into primary (to age 10) and lower secondary levels.
- General secondary (ISCED 3): General secondary schools (junior and senior secondary schools) are funded by education departments and are typically comprised of the two or three upper classes of the comprehensive school, while in countries in Central and Eastern Europe it involves longer programmes at separate institutions. In a number of countries, gymnasium streams begin in lower secondary grades.
- Degree tertiary level (ISCED 6 and 7): This covers programmes for students who have successfully completed prerequisites at the secondary level and who wish to earn a first university degree or a recognized equivalent qualification. In this publication, non-degree tertiary level (ISCED 5) or post-secondary programmes which do not lead to a university degree or equivalent are excluded, although in certain countries they account for a substantial number of students.

Foreign direct investment: FDI is a capital flow from one country to another that usually takes the form of the establishment of local production facilities or the purchase of existing businesses.

Gini coefficient: The “Gini” is a measure of the degree of inequality in the distribution of earnings/income. It is calculated as a simple “arithmetic average” of the three adjusted indices. (See also human development index.)

Gini coefficient: The “Gini” is a measure of the degree of inequality in the distribution of earnings/income. It is calculated as a simple “arithmetic average” of the three adjusted indices. (See also human development index.)

Gross domestic product: GDP is the most widely used concept of national income defined in the System of National Accounts. It represents the total final output of goods and services produced by an economy during a given period regardless of the allocation to domestic and foreign claims and is calculated...
Glossary

Population data: A concept of national income used widely. This is the annual number of deaths of infants under 1 year of age per 1,000 live births during the same period. (See also birth registration date.)

Life expectancy at birth: A widely used measure of the general level of mortality, this is the theoretical number of years a newborn will live if the age-specific mortality rates in the year of birth are taken as constant. It represents for a given year the sum of the mortality rates for all ages combined.

Life births: According to the standard definition of the World Health Organization, this includes all births, with the exception of stillbirths, regardless of the size, gestation age, or viability of the newborn infant, or his or her death soon after birth or before the required birth-registration date. Only a few countries covered in this publication employed this concept. In some situations, many used the so-called "Soviet concept", while others relied on national concepts. However, most countries have now adopted the WHO definition, and only a few still use the Soviet concept. The WHO concept excludes infants born with no breath, but with other signs of life ("stillbirths" in the Soviet concept), and infants born before the end of the 28th week of pregnancy at a weight under 1,000 grams or a length under 35 centimetres and who die during the first seven days of life ("misanriages").

Infant mortality rate: This is the annual number of deaths of children under 1 year of age per 1,000 live births.

Net material product: A concept of national income used widely in Central and Eastern Europe and the former Soviet Union before the transition, this includes the total final output of goods and productive services for a given period, but disregards activities (such as health care, education, or public administration) that do not result in material output. (See also gross domestic product.)

Population data: These refer to the total population (all people physically present in an area at the time of a population census or population estimate) as opposed to the resident population (all people who are resident in an area, including those who may be temporarily absent). Typically, refugees not permanently settled in the country of asylum are excluded. For countries for which population data are not available by age cohort, estimates have been made on the basis of data on five-year age groups by gender in the International Database of the U.S. Census Bureau. In cases in which the Census Bureau five-year age-cohort estimates need to be disaggregated to calculate indicators among cohorts, each single-year age group is taken to constitute one-fifth of the five-year cohort estimate.

Public expenditure on education: This represents current and capital expenditures on education by local, regional and national governments, including municipalities. Household contributions are normally excluded.

Rate of natural population increase: This is the difference between the number of births and the number of deaths during a given year divided by the mid-year population. It excludes changes due to migration and may be either positive or negative.

Real wage: A proxy for the quantity of goods and services a money wage can buy, the real wage represents the money wage adjusted for inflation.

Registered "ILO" unemployment: The registered unemployment rate refers to the segment of the labour force registered at labour offices as unemployed. This administrative approach reflects national rules and conditions and usually generates figures which are different from those resulting from surveys relying on the so-called "ILO concept" of unemployment. The ILO concept is based on three criteria and defines as unemployed those people who (1) have worked less than one hour in the last week, (2) are actively searching for work and (3) are currently available for work.

Teenage birth rate: This measures the frequency of childbirths among very young women. In the Statistical Annex it represents the number of live births among women 15-19 years of age per 1,000 mid-year female population in the same age group.

Total fertility rate: An overall measure of fertility, this represents the theoretical number of births to a woman during her childbearing years taking the given year's age-specific birth rates as a constant. It is calculated as the sum of the age-specific birth rates for all women of childbearing age.

Under-5 mortality rate: The U5MR measures the probability of dying between birth and age 5. It represents the annual number of deaths of children under age 5 per 1,000 live births. In the Statistical Annex the U5MR has been calculated by combining the number of under-5 deaths to the number of live births in the current year rather than in the year the deceased children were born.

Working-age population: The working-age population refers to individuals above the age of compulsory education and below the official retirement age. Most often this includes men aged 15-59 and women aged 15-54 in the countries of the region. However, this standard definition may differ from the current definitions of "working age" in some countries due to a gradual increase in the retirement age for both genders.
